

Content Engine

How a post goes from idea to published

You = your input · **Engine** = automatic · **AI** = Claude + fal.ai · **Platforms** = X, IG, FB...

Colour shows who does the work at each step.

Step 1 Something starts the process

Two ways in. The engine can start automatically, or you start it yourself.

Engine: Every morning at 6am, the cron checks which templates are due and picks one. Variables get cycled so posts never repeat.

You: Or you write a brief in the dashboard or tell Alex on WhatsApp. Same pipeline from here.

Step 2 Business context gets loaded

Before AI writes anything, the engine pulls in everything about your business.

Engine: Brand voice, uploaded documents (business plan, guidelines, pricing), and reference images all get injected into the AI prompt. This is what makes output sound like you.

Step 3 AI generates text and image

Two models run in parallel. One writes, one designs.

AI: Claude writes a different version for each platform — punchy for X, longer for Instagram, professional for LinkedIn.

AI: fal.ai creates a branded image using your colours, logo, and style references. No stock photos.

Step 4 Routed by your automation mode

You choose the level of control. Set per business in Settings.

Engine: Full auto — schedules and publishes immediately. You review after it goes live.

You: Semi auto — holds for your approval. You get notified in the dashboard or via Alex.

You: Manual — stays in drafts until you act on it yourself.

Step 5 Smart scheduler picks the best time

Each platform gets its own optimal posting time.

Engine: Instagram might go out at 10am, LinkedIn at 1pm, X at 6pm — timed for when each audience is most active. A background job checks every 5 minutes for content that is due.

Step 6 Published to all platforms

Each platform receives its own tailored version. Not a copy-paste.

Platforms: X, Instagram, Facebook, TikTok, LinkedIn, and YouTube all get their own optimised variant sent through their real APIs simultaneously.

Step 7 Results tracked, engine learns

Every result is logged. Engagement feeds back to improve the next cycle.

Engine: Successes and failures logged. Alex gets notified — failures immediately, wins in the daily summary.

Engine: Template performance scores update from engagement data. High performers get picked more often. Top posts get recycled after 30 days with a fresh angle.

■ Loop restarts — better templates rise, weak ones drop

The engine improves itself every cycle. No manual tuning needed.
